

Homework #5

School ID: 202355517 Name: 권민규

이번 Homework는 20점입니다.

1

```
#include <stdio.h>

int mydivide(int, int);

int main() {
    int x = 5, y = 2;
    printf("%d\n", mydivide(x, y));

    x = 3; y = 0;
    printf("%d\n", mydivide(x, y));

    return 0;
}

int mydivide(int a, int b) {
    return a / b;
}
```

1. 코드를 수행하여 발생한 에러가 무엇인지를 설명하라

코드를 컴파일한 뒤 그대로 실행했다.

```
gcc -o main -ggdb main.c && ./main
```

```
seworl@SeworL ~/test$ gcc -o main -ggdb main.c && ./main
2
[1] 3310 floating point exception ./main
```

부동소수점 예외를 내뱉는다. 특히 주로 0으로 나누기 연산을 할 때 주로 발생하는 오류다.

2. gdb를 실행시켜 run 및 where의 결과를 기술하라.

```
gdb ./main
run
where
```

```

> 0x555555551d4 <mydivide+18>    idiv    dword ptr [rbp - 8]

```

3. 문제를 일으키는 변수의 값과 주소, 그리고 그것이 어떤 문제를 일으키는지를 기술하라.

위에서 main 함수에서 두 번째로 mydivide를 호출하는 부분에서 오류가 발생했으므로, breakpoint를 설정하고 변수를 확인해준다.

```

b main.c:11
run
info locals

```

```

pwndbg> info locals
x = 3
y = 0

```

y값이 0이기 때문에 mydivide 함수에서 0으로 나누기 연산을 수행하며 오류를 뱉게 된다. y값의 주소를 확인해 준다.

```
print &y
```

```

pwndbg> print &y
$1 = (int *) 0x7ffff7d72c

```

2

```
#include <stdio.h>
void myInt(int*, int);

int main() {
    int a;
    myInt(&a, 10);
    printf("a: %d\n", a);

    int* b;
    myInt(b, 10);
    printf("b: %d\n", *b);

    return 0;
}

void myInt(int* ip, int i) {
    *ip = i;
}
```

1. 코드를 수행하여 발생한 에러가 무엇인지를 설명하라.

코드를 컴파일한 뒤 그대로 실행했다.

```
gcc -o main -ggdb main.c && ./main
```

```
a: 10
[1] 9397 segmentation fault ./main
```

segmentation fault가 뜬다.

2. gdb를 실행시켜 run 및 where의 결과를 기술하라.

구체적인 실행 방법은 1번 문제와 동일하므로 생략한다.

```

```

pwndbg> info locals
a = 10
b = 0x0
pwndbg> print *b
Cannot access memory at address 0x0

```

포인터 변수로 선언된 b의 주솟값이 정해지지 않았고, 그 상태에서 값을 저장하려 시도해서 발생한 오류이다.

포인터 변수인 b의 주소가 이번 오류의 분석에 필요한 건 아니라 b와 *b를 탐색하였다.

3

```

#include <stdio.h>
#include <stdlib.h>

void sort(int myData[], size_t len);
void swap(int *pa, int *pb);

enum { LEN = 5 };

int main() {
    int myData[LEN] = {2, 1, 5, 3, 6};

    sort(myData, LEN);

    printf("sorted myData:\n");

    for (int i = 0; i < LEN; ++i) {

```

```
        printf("%d\n", myData[i]);
    }

    return 0;
}

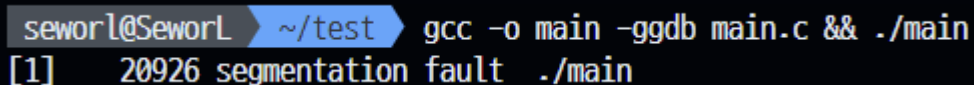

void sort(int myData[], size_t len) {
    for (int i = 0; i < (len - 1); ++i) {
        for (int j = i + 1; j < len; ++j) {
            if (myData[i] > myData[j]) {
                swap(&myData[i], &myData[j]);
            }
        }
    }
}

void swap(int *a, int *b) {
    int *temp;
    *temp = *a;
    a = b;
    b = temp;
}
```

1. 코드를 수행하여 발생한 에러가 무엇인지를 설명하라.

코드를 컴파일한 뒤 그대로 실행했다.

```
gcc -o main -ggdb main.c && ./main
```

A terminal window with a dark background. The prompt is 'seworl@SeworL' followed by a blue arrow pointing to '~/.test'. The command 'gcc -o main -ggdb main.c && ./main' is entered. The output shows '[1] 20926 segmentation fault ./main'.

segmentation fault 오류이다.

2. gdb를 실행시켜 run 및 where의 결과를 기술하라.

구체적인 실행 방법은 1번 문제와 동일하므로 생략한다.

```

3. 문제를 일으키는 변수의 값과 주소, 그리고 그것이 어떤 문제를 일으키는지를 기술하라.

swap 함수의 내부에 breakpoint를 걸어주고 변수를 확인해준다.

```
b main.c:35
run
info args
info locals
```

```
pwndbg> info args
a = 0x7fffffff710
b = 0x7fffffff714
pwndbg> info locals
temp = 0x0
```

포인터 변수 temp가 초기화되지 않은 상태에서 값을 저장하려 시도해서 발생한 오류이다.

4. 에러를 수정하여 이 코드가 의도하는 결과를 기술하라.

swap 함수를 다음과 같이 수정한다.

```
void swap(int *a, int *b) {
    int temp;
```

```
temp = *a;  
*a = *b;  
*b = temp;  
}
```

```
seworl@SeworL ~/test gcc -o main -ggdb main.c && ./main  
sorted myData:  
1  
2  
3  
5  
6
```
